

EUROPE'S AIRLINES INCREASING JET FUEL HEDGES

News / Airlines

European airlines are exploiting a collapse in oil prices by hedging more of their **fuel** needs further into the future, but those that kept their powder dry before the rout are emerging as clear winners.

At a time of heightened price volatility, carriers are also considering using more options contracts to access lower prices should they fall further.

Many airlines, however, lack the flexibility to benefit; before oil prices dropped they locked themselves into much higher costs, with some approaching USD\$1,000 per tonne of jet fuel, roughly double current rates on the spot market.

Global crude prices have fallen around 60 percent over the last 15 months and European jet fuel prices have halved.

This seems great news for cost-conscious travellers and profit-hungry airlines, which burnt through 5.4 million barrels per day (bpd) of jet fuel – 6 percent of all oil products globally – in 2012, the

most recent US government data shows.

With fuel accounting for 46 percent of Ryanair's 2014 operating costs, 33 percent of British Airways' and 21.5 percent of Lufthansa's, price fluctuations can seriously impact company profits.

To reduce price-fluctuation risk on projected operating costs, many airlines hedge a proportion of their future fuel needs six to 24 months in advance by buying jet fuel or crude oil contracts from banks or on an oil futures market.

But hedging strategies differ and not all airlines "and therefore consumers - will benefit from the low prices.

Budget carrier Norwegian Air Shuttle stands to benefit. Many European airlines were 70-90 percent hedged going into 2015, but Norwegian was largely unhedged.

"Typically we have not done much hedging," Norwegian Air's chief financial officer, Frode Foss said. "But in the last month we have started accumulating, relatively speaking, a lot of hedging to lock in fuel at very favourable levels."

The airline has hedged 23 percent of its fuel needs for the rest of this year, and 28 percent for 2016, with the potential to increase and extend hedges out to 2017, Foss said.

"You might see us at 50 percent or more, depending on the forward curve," Foss said.

Norwegian has one of the lowest hedge coverings of the major European airlines, and can buy around three quarters of its fuel for this year and next on the spot market; good news if prices fall further.

But airlines that entered the current price decline heavily hedged cannot benefit in the same way.

With 93 percent of its 2015 fuel needs hedged, according to an analyst note from HSBC, Air Berlin has been stung by falling prices.

"Our hedges come from a time when fuel was at USD\$900 a tonne. Now it's at USD\$500 - USD\$600. So it's a negative impact," the carrier's finance chief, Arnd Schwierholz, said in August.

Large hedges at prices significantly higher than the spot market can make airfares less competitive by forcing carriers to pass on the extra cost to passengers.

In March, British low-cost airline Flybe had 70 percent of the next 12 months' fuel hedged at USD\$919 per tonne.

September's European jet fuel spot price has so far been around USD\$500 per tonne.

"Some airlines that cannot afford to be as well hedged as Flybe have been reducing their prices," Flybe said in its results for the year to March.

NEED FOR CERTAINTY

Ryanair has the largest publicly declared hedging percentage among European airlines. It is 90 percent hedged for the year to March 2016 at USD\$910 per tonne, and 70 percent hedged at USD\$657 per tonne for the next year.

Ryanair's chief executive said that while low prices are beneficial, price certainty is as important a

reason to hedge.

"We don't need to be the best in the world at buying fuel, we don't need to be the one that gets the lowest price at the bottom of the cycle. We just want certainty for the next 12 months," Michael O'Leary said at a travel conference in Germany.

To achieve this, most major European airlines hedge regularly throughout the year.

Large airlines do not significantly add hedges on falling or rising prices and hedging managers commonly have little leeway to increase hedges, Commerzbank analyst Johannes Braun said.

Nevertheless, third-quarter results for this year are expected to show carriers hedging larger amounts of fuel and further out into the future than usual, industry insiders say.

Hedging strategy is also in flux.

"The tendency is to go more into an options-based hedging programme when there is market uncertainty and huge volatility," said Hans Erik Christensen, managing director at fuel risk company Global Risk Management.

Options contracts give the purchaser the right, but not the obligation, to buy or sell fuel in the future at a certain price.

Unlike simple forward purchases or swaps, options have a charge attached and most airlines - with the exception of Lufthansa, which has preferred options for many years - see them as a disadvantage.

"However, when the oil price is falling, options are an advantage. It is cheaper to hedge forwards and get protection if prices go up, but if you pay a premium for options you also retain the potential to benefit from lower oil prices more immediately," Commerzbank's Braun said.
