

TOP TRENDS IN FRACTIONAL JET OWNERSHIP FOR 2023

News / Business aviation

Fractional aircraft flights reached a new record in 2022, with hours flown growing even more than charter flights or wholly owned flights, according to data from ARGUS TRAQpak. SherpaReport President Nick Copley said: "The next 12 months will continue to be very busy for the fractional market. The reasons are multifaceted, but key trends for increased activity relate to a wider variety of aircraft, shorter wait times to gain access to fractional ownership, a more favorable buyer's market, flexible structures, and an increased focus on sustainability."

Wider variety of aircraft in fractional fleets

As more private and corporate owners show interest in the fractional space, the needs of fractional owners are diversifying and the variety of opportunities is growing. The types of aircraft being ordered vary from helicopters and turboprops to ultra-long-range jets.

Some detailed explanations by Nick Copley: "All fractional companies, therefore, including NetJets, Flexjet, PlaneSense, Airshare, AirSprint, Volato, Jet It, Nicholas Air, Volato, and

flyExclusive, have placed orders with OEMs for new aircraft that are being delivered in 2023 and shortly thereafter. Flexjet has recently added Gulfstream G650s and plans to add G700s, as well as super mid-sized jets such as Challenger 3500s. NetJets is also growing its fleet of ultra-long-range jets, ordering Bombardier Global 7500s and 8000s. It also placed an order for 100 additional Phenom 300s during COVID," he explains. Other companies adding light jets to their fleets include Volato, Jet It, PlaneSense, flyExclusive and AirSprint. Fractional companies are not just replacing aircraft, they are adding to their fleets. NetJets is aiming to have 1,000 aircraft in its fleet by end of 2023 – up from 750 before the pandemic. Flexjet is expanding its fleet from 160 aircraft pre-pandemic, to over 250 at the end of 2022, and anticipates taking delivery of approximately 40 additional aircraft in 2023."

The waitlist to become a fractional owner is diminishing

Wait times to buy a new fractional share have been extensive over the last few years, varying from months to years. However, the addition of hundreds of aircraft to fractional fleets in the U.S. will put more fractional owners into their aircraft in 2023.

"Smaller fractional providers, which offer smaller aircraft, generally have had shorter wait times," offers Copley. "Whereas at NetJets, to get a fractional share in an entry-level light jet like a Phenom 300 meant a wait of over a year, getting a share on a Pilatus PC-24 at PlaneSense would be much faster." Customers requiring large ultra-long-range jets will have a more limited choice between the big fractional companies like NetJets and Flexjet. In the coming year, however, the wait times at even the larger companies will diminish due to the new deliveries and leveling off for demand.

2023 will be a kinder year for buyers

According to Nick Copley, this year, we will start seeing something resembling more of a buyer's market, as the market starts to level out from the recent rapid growth and the supply of fractional aircraft increases, some level of negotiation is likely to return.

New flexible structures will entice some to fractional ownership

Traditional fractional agreements consist of four payments: the initial purchase, a monthly management fee, hourly usage charges, and variables, including fuel. Newer providers have entered the market over the past few years and are trying alternative structures to woo customers. Some examples include no monthly management fees (flyExclusive and Volato), rebates (Volato), unlimited hours and days (Volato), using your fractional to train to be a pilot (Jet It), day-based programs (Jet It and Airshare), and designer aircraft with dedicated crew (Flexjet Red Label).

Sustainability

Customers who in the past shied away from ownership – whether full or fractional – due to environmental concerns may be at least partially swayed in 2023 and beyond.

"The business aviation industry is aware of the need to increase sustainability and fractional companies are no exception," explains Copley. "To differing degrees, fractional companies are increasing their use of sustainable aviation fuels (SAF), purchasing carbon offsets, pledging to become carbon neutral, using book-and-claim, and reducing their ground emissions," he states.

Here are examples: NetJets has committed to buying 3 million gallons of SAF, while Flexjet offsets 300% of the carbon emissions from every flight. AirSprint, Volato and flyExclusive also have carbon offset programs. Because SAF is not yet available at most airports, a "book-and-claim" registry allows an aircraft to utilize SAF where available while another operator pays for it and claims the credit – some operators are using this method. A number of operators are also reducing their environmental footprints on the ground, including AirSprint and NetJets. Finally, some newer aircraft being added have an Environmental Product Declaration, which confirms their sustainable sourcing and manufacturing.
