

ETIHAD AIRWAYS ENGINEERING TO USE BIGREP 3D PRINTERS IN THEIR MAINTENANCE, OVERHAUL AND REPAIR FACILITY

News / Maintenance / Trainings, Manufacturer

Etihad Airways Engineering to install large-scale 3D printer Bigrep ONE to print parts and tooling, followed by a next generation Bigrep EDGE industrial 3D printer to develop, test and certify material for aircraft parts.

Bigrep, the global leader in large-scale 3D printing, and Etihad Airways Engineering have announced today that the airline MRO will deploy a Bigrep ONE 3D printer in its Maintenance, Operations and Repair facility at the Etihad home base in Abu Dhabi. The printer will be used in daily operations to print jigs, fixtures and (non-flying) parts on site and on demand.

Its arrival highlights the first phase in a partnership between Bigrep and Etihad Engineering established earlier this year, and will be followed by deploying the next-generation industrial 3D printer Bigrep EDGE, with the aim to jointly develop, test and certify new materials for 3D-printed aircraft cabin parts. With the introduction of the new industrial 3D printers PRO and EDGE, unveiled just two weeks ago, Bigrep is moving forward to the production of end-use parts for the aerospace industry.

Bernhard Randerath, Vice President Design, Engineering & Innovation of Etihad Airways Engineering says: “We are at the forefront of bringing this exciting technology into aviation and will work with our partners to ensure a successful certification of 3D printing

technology, and with it towards the vision of a 3D-printed cabin.”

Stephan Beyer, CEO of Bigrep GmbH, says: “Thanks to our 3D printers, we will accelerate the use of Additive Manufacturing in the aviation industry. With the Bigrep PRO and EDGE, we will be able to unfold the full potential of our technology, together with Etihad Airways Engineering. These machines offer an unprecedented level of precision, quality and speed, and enable us to use the high-performance, innovative printing materials the aviation industry requires.”

As an innovation leader, Etihad Airways Engineering will leverage its experience around the aircraft cabin and will provide its design organisation approvals, as well as production organisation approvals and in-house flammability lab to test the 3D printed parts. In particular, Bigrep’s large-scale 3D printers are suited to printing large cabin parts with the possibility of a high level of customisation – one of the most challenging requirements in the airline industry.

In addition, the aim is to jointly develop and test new material grades in accordance with EASA and FAA criteria, as there is a need for a wider spectrum of AM-suitable polymer materials that can pass the aerospace certification process.
